

Explosive Ordnance Child Victims: Prevention and Response

The survey was designed to increase understanding of the current level of collaboration between Clusters, AoRs and other relevant entities towards four collective outcomes related to the prevention and response to Explosive Ordnance Child Victims:

1. Prevention: Reduce the number of children who have an accident with an explosive ordnance;
2. Reduce Mortality: Increase the survival rate of child casualties through increased access to first aid, access to safe blood cold chains, trauma surgery, and ongoing medical care;
3. Increase personal capacity of child survivors through rehabilitation, as well as mental health & psycho-social support (MPHSS) of both child survivors and their caregivers;
4. Social Inclusion: Increase inclusion of child survivors in family, community and school life.
